object

- a data structure containing data (..... :o)
- this data is in the form of *fields*, also called *attributes* (e.g. x and y components of a point)
- also has *methods* or *functions* used to access the data contained in an object

object

ok but how to python?

```
class ObjectName:
    def __init__(self[, arg1, arg2,
...]):
        self.arg1Field = arg1
        self.arg2Field = arg2
        # and so on!

    def getSomething(self[, arg1, ...]):
        # do stuff, return something
```
